# AI FOR REFRIGERATION

Giving Grocers Millions

# THE PROBLEM

## Refrigeration Energy is Extremely Expensive

A Grocer's highest expense is energy with 50% - 60% from refrigeration. It is **hundreds of millions** of dollars annually per chain.

## Optimization is an Afterthought.

Grocers barely maintain operability due to retiring workers and dwindling pool of experts. Manual optimization cannot compare to AI driven automation.

## The Grocery Vertical is Technologically Stale.

Energy is skyrocketing, little has changed to reduce the billions in cost. Entrenched vendors solutions are weak at high cost.

# THE SOLUTION – Dynamic Load Harmonization (DLH)

Energy Optimization through AI

## SUBSCRIBE

Subscribe to DLH for  
immediate savings  
**13% - 40%**  
Immediately upon  
activation.

## PREDICT

Predictive control of  
refrigeration through  
AI, digital twin, and  
proprietary physics  
models.

## TREND

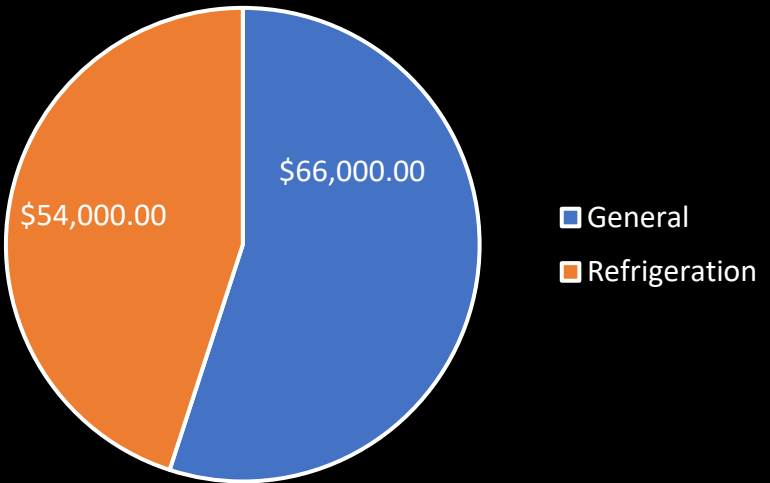

Trend and historical  
analysis predicts costly  
issues and maintenance  
opportunities with  
unlocked data.

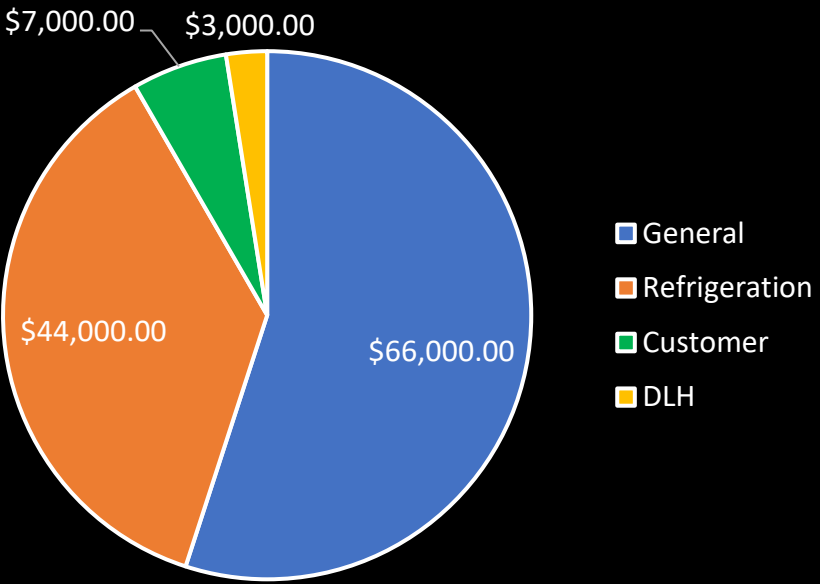

# Creating a Greener Energy Future at Zero Cost to You

Current Monthly Energy Spend  
**100% Goes to the Utility**

AI Store Energy Strategy

**DLH gives some of your existing energy budget back to you.**

# Dynamic Load Harmonization – IP and Methods

Reduce Your kWh Consumption with these AI models and more:

- **Suction Pressure Regulation:** Control of refrigerant volume.
- **Superheat Control:** The degrees a vapor is above boiling point/saturation temperature at pressure.
- **Condenser Fan Speeds:** Air speed in condenser removing heat from refrigerant.
- **Expansion Valve Adjustment:** Regulates refrigerant into evaporator coil, lowering pressure and allowing evaporation.

NEJAVI uses a “basket of strategies” and AI to optimize cooling.

## SECURITY

Standard cloud security protocols and will pass strict ITSEC requirements.

## RECOVERY AND REDUNDANCY

During an internet outage, original set-points maintained, normal operation continues until recovery.

## ONLINE VISIBILITY AND CONTROL

All sites and systems can be viewed online and controlled by administrators remotely.

Cases

# AI in Action - Electronic Expansion Valve Strategy

## Normal Operation

**Red Line = Electronic Expansion Valve**

Wide swings in open/closed cause:

- Wasted energy
- Temperature Fluctuations of degrees
- Unnecessary compressor wear

## Surrogate Modeling - AI in Action

**Red Line = AI Electronic Expansion Valve**

Flattened open/closed causes:

- Reduced energy consumption
- Smaller Temperature Fluctuations
- Reduced compressor load

This is a single strategy in our group of more than 25 strategies.
